

The left curtain martingale coupling

We conjecture that if $X \leq m$, then $Y = X$, otherwise $Y = T_u(X)$ with probability $q(X)$ or $T_d(X)$ with probability $q(X)$, with $T_d(x) \leq x \leq T_u(x)$, with $q(x) = \frac{x - T_d(x)}{T_u(x) - T_d(x)}$ to respect the martingale condition, and we guess that $T_d : (m, \infty) \rightarrow (-\infty, m)$ is decreasing and $T_u : (m, \infty) \rightarrow (m, \infty)$ increasing for the left curtain coupling.

- For $y > m$ with m in the support of ν , then $y = T_u(x)$ for some $x > m$. Then

$$1 - F_\nu(y) = \mathbb{P}(Y > y) = \mathbb{P}(\mathbb{P}(Y > y|X)) = \mathbb{E}(q(X)1_{T_u(X) > y})$$

so

$$1 - F_\nu(T_u(x)) = \mathbb{E}(q(X)1_{T_u(X) > T_u(x)}) = \mathbb{E}(q(X)1_{X > x})$$

and differentiating we find that

$$\frac{d}{dx}F_\nu(T_u(x)) = T'_u(x)F'_\nu(T_u(x)) = q(x)F'_\mu(x)$$

for $x > T_u^{-1}(m) = m$, so we see that $T'_u(x) > 0$ as required for the left curtain coupling.

- Conversely for $y \leq m$, then $y = T_d(x)$ for some $x > m$, but there are two ways for Y to get to y : either we came from $X = y$, or $y = T_d(x)$ with $x > m$, so

$$\begin{aligned} F_\nu(y) &= \mathbb{P}(\mathbb{P}(Y \leq y|X)) = \mathbb{P}(X \leq y) + \mathbb{E}((1 - q(X))1_{T_d(X) \leq y}) \\ &= F_\mu(y) + \mathbb{E}((1 - q(X))1_{T_d(X) \leq y}) \end{aligned}$$

so

$$F_\nu(T_d(x)) - F_\mu(T_d(x)) = \mathbb{E}((1 - q(X))1_{T_d(X) \leq T_d(x)}) = \mathbb{E}((1 - q(X))1_{X \geq x})$$

(note the change of inequality in the final indicator since T_d is decreasing), then differentiating we find that

$$\frac{d}{dx}(F_\nu(T_d(x)) - F_\mu(T_d(x))) = T'_d(x)(F'_\nu(T_d(x)) - F'_\mu(T_d(x))) = -(1 - q(x))F'_\mu(x) \quad (1)$$

for $x > T_u^{-1}(m) = m$, so we have recovered Eqs 3.12 and 3.13 in [HT15], and we see that $T'_d(x) > 0$ in the region where $F'_\nu < F'_\mu$ (which is $[-1, 1]$ for the simple uniform example below). T_d is increasing???

Example

For the case when μ is $U[-1, 1]$ and ν is $U[-2, 2]$, sees we don't need an m , so there is no F'_μ in (1), in which case $T'_d(x) < 0$, and we seemingly find that $T_u(x) = \frac{3}{2}(x + 1) - 1$, and $T_d(x) = -\frac{1}{2}(x + 1) - 1$
